1s2p RIXS-Magnetic Circular Dichroism (RIXS-MCD) [1-3], is a recently discovered, bulk-sensitive element-specific photon-in photon-out spectroscopy, using circular polarized hard x-rays to probe the local magnetism, usually at the 1s pre-edge of 3d transition metal oxides. In this talk, we will demonstrate that this same technique can be used to study chiral crystals, which we call “RIXS-Natural Circular Dichroism (RIXS-NCD)” and which gives a dichroic signal resulting from the chiral nature of the probed material. We present the first results on this new spectroscopy on cobalt- and manganese- based chiral compounds.
